

# Upcoming requirements and needs for heating from a Nordic perspective

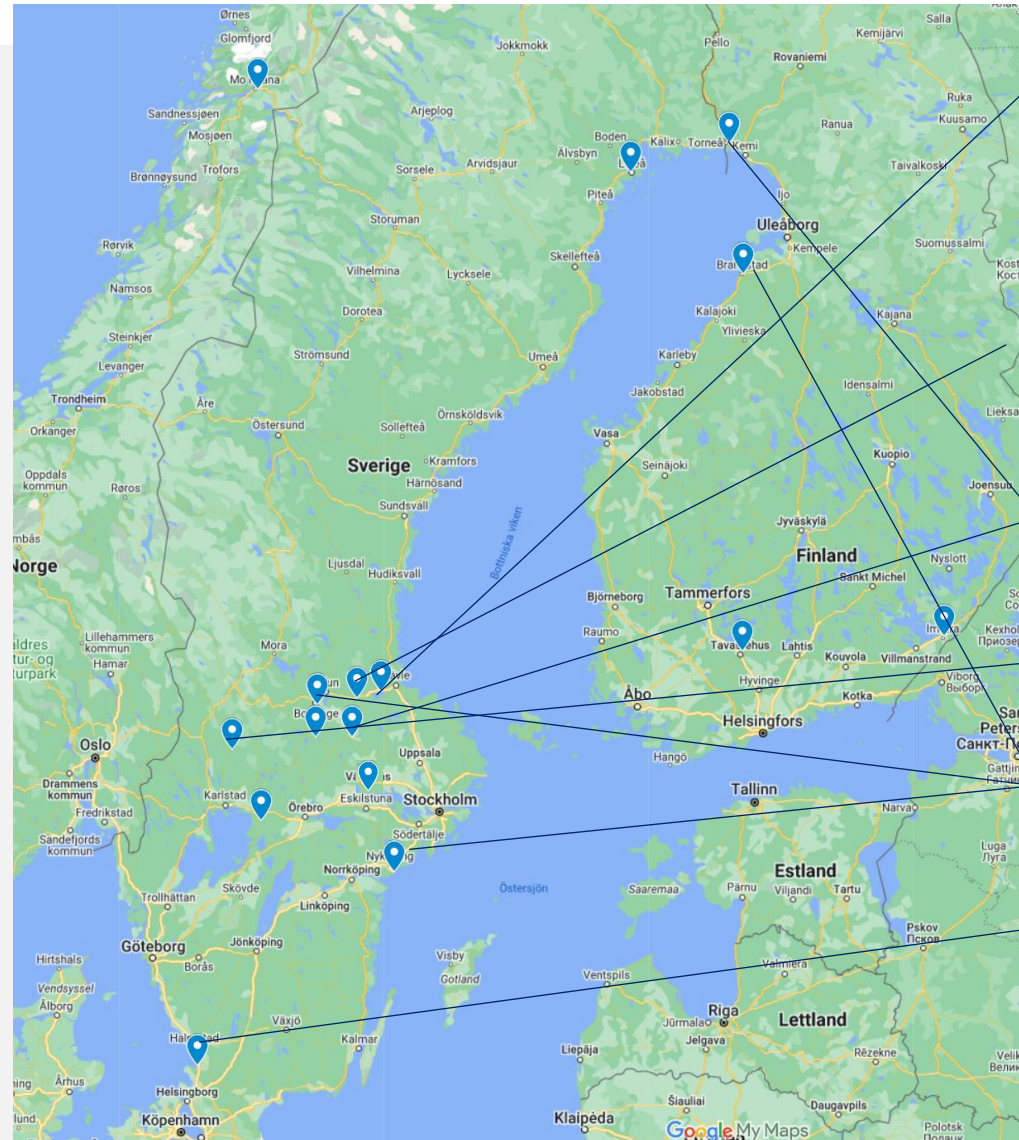

2023-03-15

**SSAB**

A photograph of two people in a control room. A man in a dark blue jacket with bright yellow reflective stripes is leaning forward, looking at a computer monitor. A woman with blonde hair, also wearing a similar jacket, is looking at the same monitor. The background shows multiple computer screens and control panels.

# Nordic Steel Industry

- ▶ Many steel mills in category special steel
- ▶ Relatively small production units
- ▶ Large variety of products
- ▶ Process development essential

 Höganäs 

 SSAB

# Nordic situation

- ▶ No major NG pipeline
  - ▶ Electricity price comparable low and fortunately high degree fossil free.
  - ▶ Large forest industry
  - ▶ Cold weather
  - ▶ Environmental legislations demands (NOx, CO2)
- 
- ▶ Historically a lot of different fuel has been used.
  - ▶ High degree of downstream electrification.
  - ▶ Oxygen combustion since 1991 and widespread.
  - ▶ Potential for gasification of residuals from forest, sawmill and agriculture, Methanol, DME, Syngas...
  - ▶ District heating profitable

# Major steps in present and upcoming time

- ▶ Höganäs: Bio-gasification plant for energy gas and bio-coke, inaugurated 2019.
- ▶ Ovako: investment in Hydrogen for reheating, commissioning 2023 (20MW Hofors). Continues with oxyfuel conversion on large scale.
- ▶ Bio-DMI tested in industrial scale at Björneborg steel mill 2022.
- ▶ SSAB: Planning for CSP in conjunction to new steel mills.
- ▶ Alleima: Hydrogen combustion trials in production furnaces. (2022)
- ▶ Outokumpu Avesta: Oxygen in slab reheating 2023.
- ▶ Several trials and ordinary operation with the mixing of biomethane
- ▶ Joint research: plasma burner, H2 tests, electrical heating methods, measuring techniques.

Ovako Roadmap: CO2e emissions, scope 1&2 only  
– Tonnes CO2e, all production, fixed volume (2020)

1

## SSAB to bring fossil-free steel to the market in 2026

- Launch of a premium product with no fossil CO<sub>2</sub> footprint
- This means no fossil CO<sub>2</sub> emissions when producing this product, and a requirement to use fossil-free sponge iron

2

## SSAB to have leading sustainability performance; largely fossil-free around 2030

- Largely eliminate CO<sub>2</sub> emissions from our own operations in around 2030
- This means almost no CO<sub>2</sub> emissions from our own operations and purchased energy

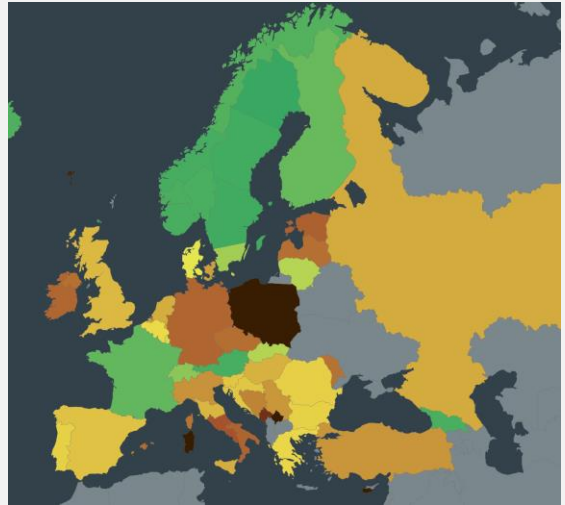

SCIENCE  
BASED  
TARGETS

DRIVING AMBITIOUS CORPORATE CLIMATE ACTION

# Summary of Nordic conditions and premises for CO2-free heating

- ▶ The market is the driving force
- ▶ Small production units
- ▶ Electrification (in any form) an attractive alternative
  - Experience of electrification
  - O2 combustion already in place at many places
  - H2 via electrolyze a tangible alternative
- ▶ Bio based fuel (e-fuels) a complementary strategy

electricitymaps.com

*Will Nordic countries lead the implementation of new technologies?*

# Change in technology

*A combination or exclusive utilization of either technology is to be considered.*

Induction heating

*Fast and high efficiency at low temperature*

Hydrogen/Biogas + Oxygen

*Heating high atmosphere T*

Electrical element heating.

*When lower heating demands. Eg soaking*

# Heating Systems Hardware

- ▶ Support the demands for meeting material properties
  - Temperature distribution within material  
Example: heating solutions that eliminates/avoids skid marks.
  - Surface quality  
Example: oxidizing/reducing atmosphere
- ▶ Controllability
  - Behave consistent and predictable
  - Example: heat distribution, correctly dimensioned valves for precise oxidizer/fuel ratio setting in all operating modes
- ▶ Efficiency
  - Eliminate heat losses
  - Heat recovery, flue gas condensation
- ▶ Durability
  - Direct electricity methods, refractory...

# Heating System Control

## Today:

Furnace (material) is controlled by temperature. Temperature is the “only” measure for fulfill heating criteria.

## Future:

Material properties to be controlled.

- ▶ Measuring or other approaches for establish initial state
  - Analyses, dimension, oxide, defects, grain size, carbide size distribution
- ▶ Online methods for predict material properties during heating
  - Material physical properties (T&t- depended) \*)
  - Measuring techniques, direct: elongation of material boundary conditions: temperature, atm...
  - Models, 3d representation of material and boundary conditions.
  - Scale formation
- ▶ Feedback systems
  - Short: mill temperature or LUS measurements
  - Long: material properties at samples

\*) Especially the electromagnetic properties when utilizing induction.

# Heating System Control & Supervision

1. Need to meet requirements for material conditions
  2. Energy and environmental optimized
  3. A minimum of unplanned maintenance and rework
- ▶ Ensure basic measurement and settings.
    - E.g. thermocouple placing, air/fuel control, distribution of fuel to several burners
    - Condition Monitoring of equipment and furnace (AI)
      - Thermocouples, Electrical elements, energy consumption and emissions.
  - ▶ Expanding the scope of measurements and control capabilities.
    - IR-cameras for measuring flame conditions or hot spots
    - Refractory status measurements
    - Flame length control

Questions during the panel discussions!
